## Part III DETAILED ACTION Election/Restriction

- 1. Applicant's election of Group I, claims 1-12 and 61 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (M.P.E.P. § 818.03(a),). Upon further consideration by the Examiner the election of species is withdrawn.
- 2. Newly amended claims 1, 6, 12, and 40 are directed to the nucleic acid and host cells of Group I and IX as set forth in the original restriction (see Paper No. 8). Since Group I drawn to the nucleic acid comprising  $Cry\ j$  I and Group IX drawn to the nucleic acid coding for  $Cry\ j$  II are distinct for the reasons set forth in Paper No. 8, said claims will be examined to the extent said claims read on  $Cry\ j$  I.
- 3. Claims 13-39, 41-60, and 62-121 are withdrawn from further consideration by the examiner,, 37 C.F.R. § 1.142(b) as being drawn to a nonelected invention was made **without** traverse in Paper No. 10.

## Claim Rejections - 35 USC § 112

4. Claims 1-12, 40, and 61 are rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 1, 6, and 12 are rejected since it is not clear what the metes of the claimed subject matter. Do applicants intend the claimed subject matter to encompass a chromosome?

Claim 5 is rejected for use of the term "consists essentially" since said term is not used to define the metes and bounds of a claimed compound.

Serial Number: 08/226,248

Art Unit: 1806

Claim 61 is rejected since it refers to a claim which was withdrawn from consideration.

5. The following is a quotation of the first paragraph of 35 U.S.C. § 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

The specification is objected to under 35 U.S.C. § 112, first paragraph, as failing to adequately teach one of ordinary skill in the art how to make and use the claimed invention, i.e. failing to provide an enabling disclosure.

The specification provides insufficient guidance to a nucleic acid coding for the Cry I j species as broadly claimed which encompass modifications (i.e. deletions, additions, functional equivalents, or fragments). The scope of the claims is not commensurate with the enablement provided by the disclosure with regard to the extremely large number of deletions, additions, or modifications broadly encompassed by the claims and the claims broadly encompass a significant number of inoperative species. The amino acid sequence of a protein determines its structural and functional properties, and the predictability of which changes can be tolerated in a protein's amino acid sequence and still retain similar activity/utility requires a knowledge of and guidance with regard to which amino acids in the protein's sequence, if any, are tolerant of modification and which are conserved (i.e. expectedly intolerant to modification), and detailed knowledge of the ways in which the proteins' structure relates to its function. While recombinant and mutagenesis techniques are known, it is not routine in the

Serial Number: 08/226,248

Art Unit: 1806

art to screen for positions within the protein's sequence where amino acid modifications can be made with a reasonable expectation of success in obtaining similar activity/utility are limited in any protein and the result of such modifications is unpredictable based on the instant disclosure. One skilled in the art would expect any tolerance to modification shown for a given protein to diminish with each further and additional modification, e.g. multiple deletions. The sequence of some proteins is highly conserved and one skilled in the art would not expect tolerance to any amino acids modification in such proteins. Bowie et al. (Science 247:1306-1310) teach positions in the sequence that are critical to the protein's structure/function relationship, can tolerate only relatively conservative substitutions or no substitutions (see pages 1306-1310, especially p. 1306, column 2). Furthermore Kumar et al. (PNAS 87:1337-1341 1990) teach amino acid variations at a single residue of a peptide can affect T cell activation and other properties. The specification does not support the broad scope of the claims because the specification does not disclose the specific positions which can be predictably modified and which regions are critical.

Thus, applicants have <u>not</u> provided sufficient guidance to enable one skilled in the art to make and use the claimed protein in manner reasonably correlated with the scope of the claims broadly including any number of deletions of any size. The scope of the claims must bear a reasonable correlation with the scope of enablement (<u>In re Fisher</u>, 166 USPQ 19 24 (CCPA 1970)). Without such guidance, the changes which can be made in the proteins structure and still maintain activity/utility is unpredictable and the experimentation left to those skilled in the art is unnecessarily, and improperly, extensive and undue. See <u>Amgen</u>, <u>Inc. v. Chugai Pharmaceutical Co. Ltd.</u>, 927 F.2d 1200, 18 USPQ2d 1016 (Fed. Cir. 1991) at 18 USPQ2d 1026-1027, <u>Ex parte</u>

<u>Forman</u>, 230 U.S.P.Q. 546 (Bd. Pat. App. & Int. 1986), and <u>Ex</u> parte Anderson, 30 USPQ 2d 1866 (Bd. Pat. App. & Int. 1993).

- The specification describes the nucleic acid sequence coding for Cry j I and the deduced amino acid sequence (page 7). The specification teaches the purification and cloning of Cry j The specification also discloses peptides of Cry j I that have T cell stimulating activity. The specification disclose binding assays of IgE to purified and recombinant Cry j I and histamine release analysis. The specification does not identify particular antigenic fragments that modify B cell responses. specification does not identify particular antigenic fragments that bind IgE but do not result in mediator release. specification also does not identify which modifications to  $\mathit{Cry}\ j$ I would result in the reduction of an allergic response following the administration of the modified  $Cry \ j$  I. The specification also does not identify fragments or proteins of the peptides having T cell epitopes of Cry j I or any of the other properties listed above. In the absence of evidence to the contrary, it would require undue experimentation to test the isolate the nucleic acid encoding the Cry j I fragments, functional equivalents, or peptides for the properties listed above.
- 6. Claims 1-12, 40, and 61 are rejected under 35 U.S.C. § 112, first paragraph, for the reasons set forth in the objection to the specification.
- 7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dr. Anthony C. Caputa, whose telephone number is (703)-308-3995. The examiner can be reached on Monday-Thursday from 8:30 AM-6:00 PM.

Any inquiry of a general nature or relating to the status of this application should be directed to the Group receptionist, whose telephone number is (703)-308-0196.
